Civil Geometry

- A complete set of horizontal tools for schematic and horizontal geometric design
- Tools for Alignments **AND** the other 99% of geometric civil features
- Provide the Civil Workflow better geometry
 - Integrated
 - Improved User Experience
 - Rules based placement and editing to maintain relationships

Concepts

Advanced interface = Heads up prompts, graphical and dynamic feedback

Associative = Geometric elements have relationships which should be preserved.

Rules-based = The associations are preserved in rules which preserves design intent.

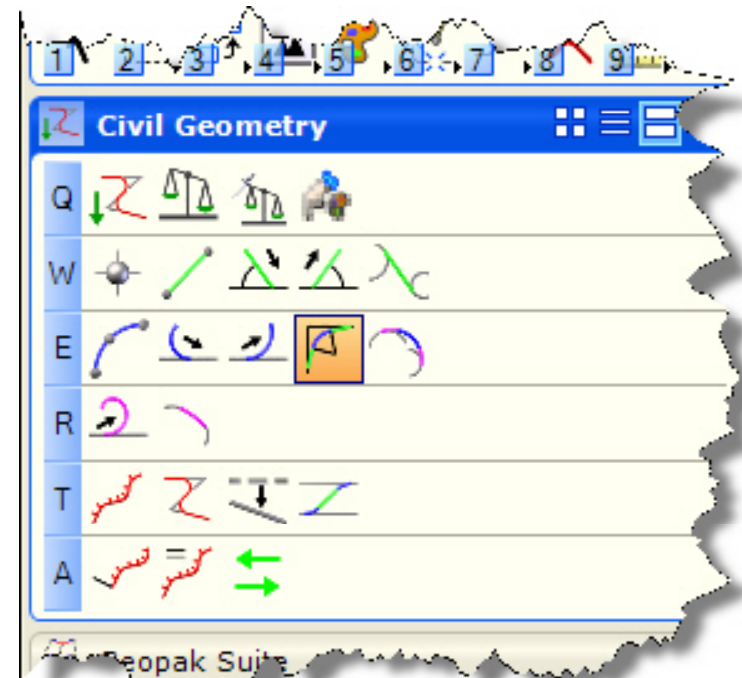

Relationships

Not only is the design intent for individual elements preserved but the relationships between elements are also preserved.

For example: All edges of pavement are laid out based on a relationship to a centerline (or baseline) using offsets, stationing and perhaps tapers. Preserving these relationships updates the edges if the centerline changes, saving you work.

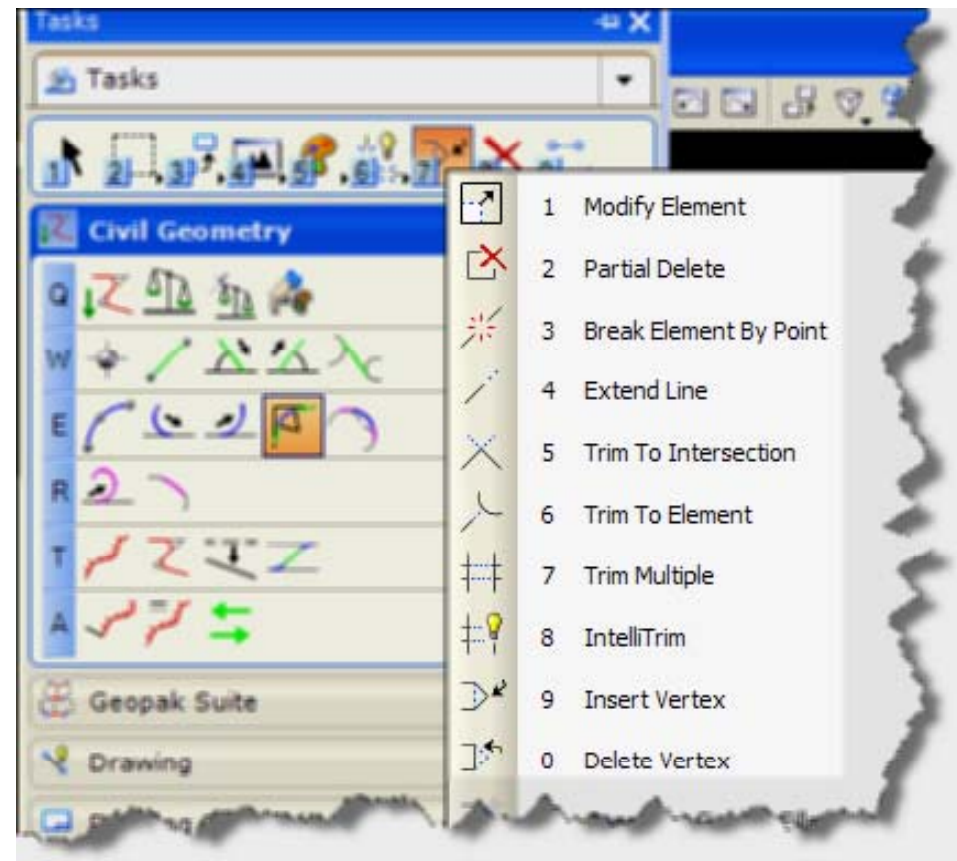

The Geometry Toolset

- New Commands added as MSTN Tasks
- Commands are:
 - Integrated with Microstation
 - Dynamic
 - Utilize graphical feedback
 - Create rules based elements
 - Preserve user input and relationships

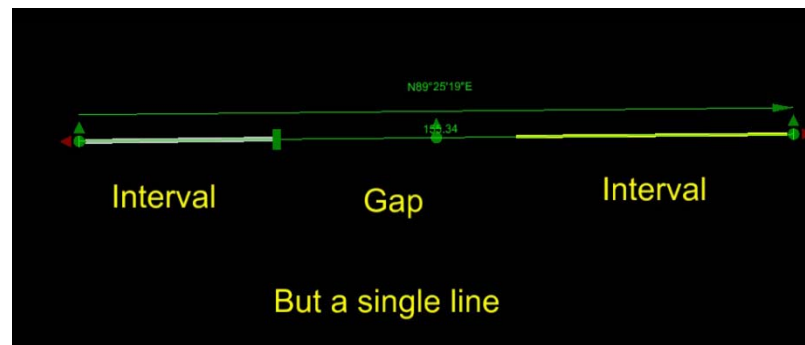

Microstation Modify Commands

- Modify Commands will interact with civil elements

Intervals and Gaps

- The intervals can be used in any command, or the base geometry can be used.
- Some commands allow you to pick the pieces of complex elements – those commands that require arcs for example will let you pick an arc that's inside a complex.
- When we make a civil complex element – we hide the original elements and our complex rule saves relationships to the original elements and whether it is forward or reversed within the complex.

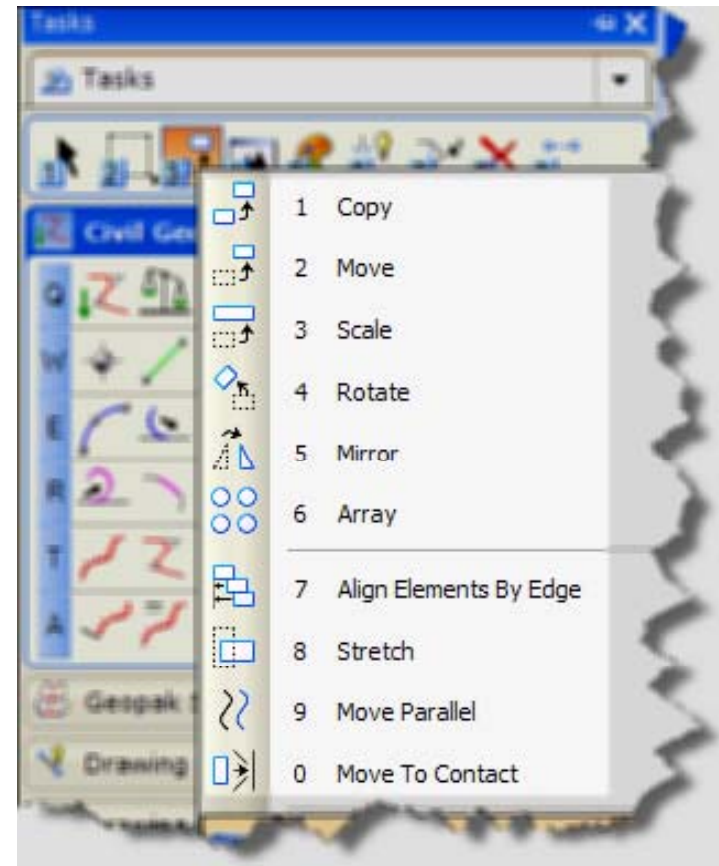

Intervals and Gaps

- “Base Geometry” – the original created element with its rule. Base geometry is always preserved.
- An interval is where the base geometry is shown (visible) – a gap is where it is not shown.
- Geometry commands that trim or extend create intervals along the original “base geometry”.
- The MS modify commands create intervals or gaps along the original base geometry.

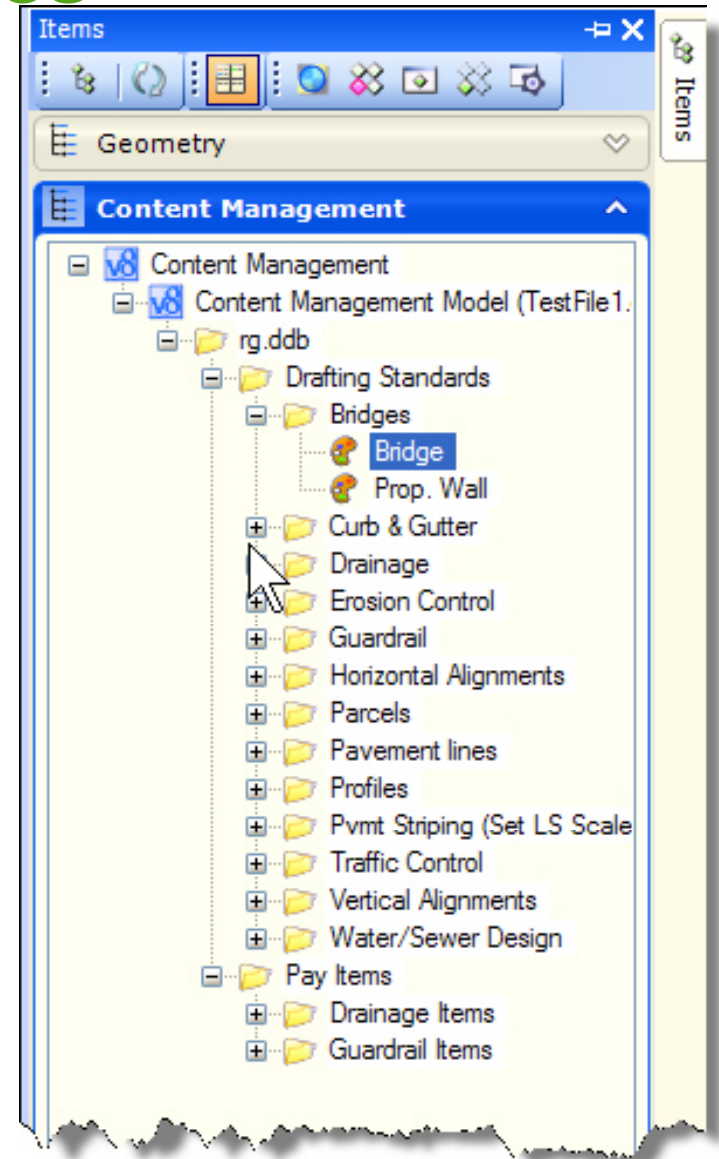

Microstation Manipulate Commands

- Manipulate Commands will not interact with civil elements unless you remove the rule first.

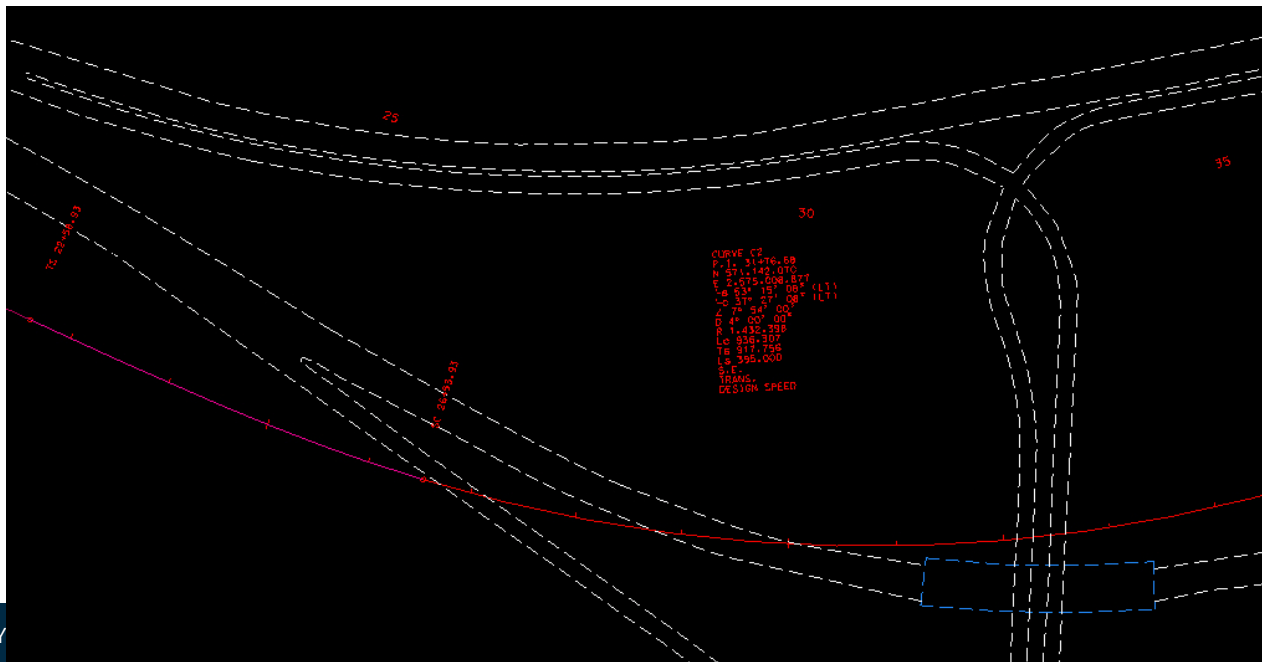

Feature Tables

- Preserves user investment in Feature tables developed for GEOPAK, InRoads and MXROAD.
- Uses DDB, XIN or PSS files for feature definitions.

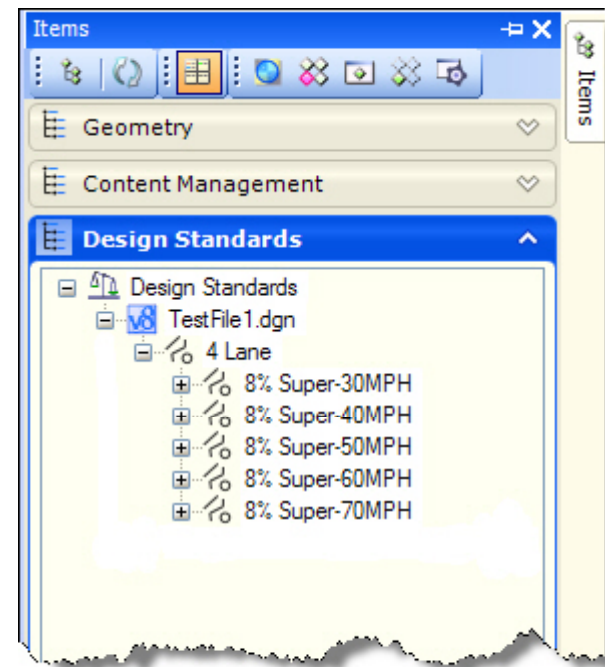

Annotation

- Annotation can be applied automatically at time of element creation.
- Annotation is determined from your existing DDB, XIN or PSS files

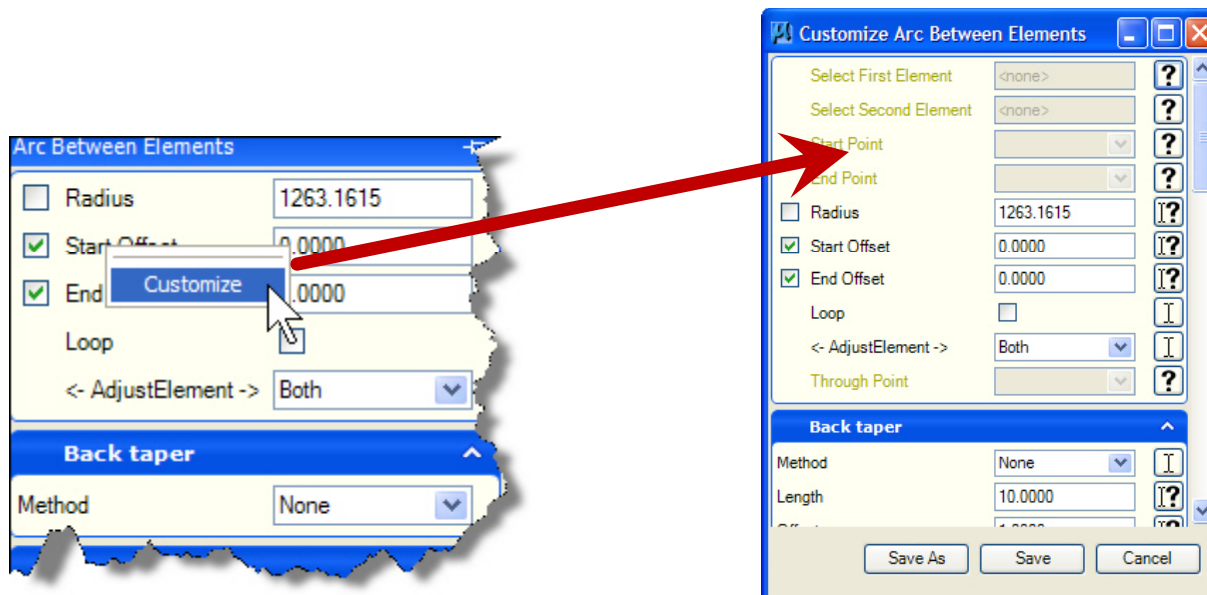

Design Standards

- Design standards control the geometry radius and transition lengths
- For SS1 this is very alignment specific.

Command Customization

- Right click the command dialog to customize its function. This allows you to create variable versions of tools to accomplish workflows.

Workshop Agenda

Workshop Agenda

Workshop Agenda

- Examine the New Tools
- Focus on Geometric Layout of Intersection
